Bridge Business Requirements Document

Student talent marketplace | Version 1.0 | 2 November 2026

Business summary

Bridge is presented in the Stitch screens as a marketplace that connects students offering skills with people or organizations posting paid tasks. Students can show profiles and portfolios, discover work, and apply. Task owners can describe opportunities, review candidates, and communicate with accepted participants. This document states the business capabilities implied by the prototype. It does not assume a geography, customer segment, revenue model, or operating policy that the source does not provide.

Business problem and opportunity

The product concept addresses a two-sided coordination need: students need a structured way to present capabilities and find relevant project work; task owners need a way to describe work and evaluate student applicants. The current source is a UI prototype, so this is a problem framing, not validated market research. The business should validate the need, initial market, and willingness to participate before committing to operating targets.

Business objectives

- Establish a usable path for a student to present skills and apply to a task.
- Establish a usable path for a task owner to publish work and evaluate applicants.
- Support an authorized transition from application to accepted relationship and communication.
- Build enough trustworthy profile, task, and application information to help both sides make an informed choice.
- Define sustainable marketplace operations, trust controls, and any commercial model before launch.

No numeric targets were supplied. Baselines and targets should be set after selecting an initial market and collecting pilot data.

Stakeholders

Stakeholder	Interest / responsibility
Students	Profile, skills, work discovery, application status, privacy, and safe communication.
Task owners / clients	Task creation, candidate review, decision rights, and communication.
Business/product owner	Target market, marketplace rules, priorities, value proposition, and commercial model.
Operations/trust owner	Account/task quality, reporting, moderation, disputes, and policy enforcement; role and tooling need confirmation.
Engineering	Secure identity, consistent task/application lifecycle, data protection, and reliable service.

Business requirements

ID	Requirement	Business rationale	Evidence / status
BR-01	The service shall support student and task-owner participation.	A two-sided marketplace needs both work supply and demand.	Role selection and separate student/freelancer screens; exact account model open.
BR-02	Students shall be able to present capabilities and portfolio evidence.	Task owners need relevant applicant context.	Onboarding/profile skills and portfolio fields are visible.
BR-03	Students shall be able to discover tasks and submit a proposal.	Creates the supply-side participation path.	Student home, task detail, and apply screens are visible.
BR-04	Task owners shall be able to create work opportunities with scope, skills, budget, and deadline.	Provides enough information for discovery and evaluation.	Task form and task details display these attributes.
BR-05	Task owners shall be able to review applicants and record a decision.	Enables selection and movement toward a working relationship.	Applicants screen includes Accept and Reject.
BR-06	The system shall present users with their own application or match states.	Makes progress visible and supports next actions.	Matches screen groups relationships by state; exact definitions open.
BR-07	Eligible participants shall be able to communicate about work.	Supports coordination following a match.	Chat screen and Open Chat actions are visible.
BR-08	The service shall protect private profile, application, and conversation information.	Trust and privacy are required for a two-sided marketplace.	Business control proposed; details must be approved.
BR-09	Any displayed financial or quality metric shall have a defined source and calculation.	Prevents misleading pending-payment, earning, rating, and completion displays.	Such metrics appear in screens; definitions are absent.

Business process overview

1. **Join:** participant selects a mode and authenticates; student provides profile information.
2. **Create work:** task owner enters task description, skills, budget, and deadline; task enters an agreed publication state.
3. **Discover and apply:** students browse public tasks, review details, and submit proposal/portfolio evidence.
4. **Evaluate:** owner reviews applicant information and accepts or rejects.
5. **Coordinate:** eligible parties access a conversation and project context.
6. **Complete and measure:** any completion, payment, or rating workflow must be defined separately; it is not established by the prototype.

Scope and exclusions

Initial business scope

- Participant modes and profiles.
- Task publishing and discovery.
- Applications and owner decisions.
- Match/application status views.
- Text communication for eligible parties.

Not yet committed

- Commissions, subscriptions, listing fees, or other revenue model.
- Payments, escrow, payouts, refunds, or tax reporting.
- Geography, language, eligibility rules, student verification, or business licensing.
- Matching/recommendation algorithm, service-level guarantee, or quality assurance program.
- Disputes, cancellations, fraud handling, safety response, or moderation workflow.

Business value and measurement

Candidate measures for a pilot include completed student profiles, published tasks, application rate, owner response time, acceptance rate, repeat participation, and completed tasks. If payment becomes part of scope, separately define gross transaction value, fees, payout timing, refunds, and reconciliation. For every measure, define owner, source of truth, calculation, reporting cadence, and privacy controls before using it for decisions. No targets are implied here.

Assumptions and constraints

- The Stitch board describes intended experience, not proven demand or approved policy.
- The marketplace likely needs both student and task-owner participation, but users may or may not have both modes.
- The screen labels "Freelancer" and "client" may describe the same task-owner side; confirm naming and business role.
- Budget and payment summary displays do not demonstrate an actual funds flow.
- Ratings, verified status, earnings, completion metrics, and "matches" need explicit business definitions.

Business risks

Risk	Business impact	Mitigation / decision needed
Unclear target market and demand	Product may not solve a priority problem for either side.	Select a pilot segment and validate with users before committing targets.
Two-sided marketplace imbalance	Too few tasks or applicants weakens participation.	Define launch market, acquisition plan, and minimum viable liquidity measures.
Undefined payment expectations	Budget and payment labels may imply functionality the service does not provide.	Clarify whether payments are in scope; otherwise label displays accurately or defer them.
Unclear trust/verification model	Misleading quality signals or unsafe interactions.	Define verified badge, ratings evidence, moderation, reporting, and response ownership.
Ambiguous status model	Users may misunderstand application and match progress.	Approve lifecycle labels and transition rules before implementation.

Decisions required from business owner

1. Who is the initial customer and launch market (students, organizations, agencies, or individual clients)?
2. What is the business model and what, if anything, does Bridge charge for?
3. What does "Freelancer" mean in this product, and can an account also be a student?
4. What work categories, eligibility criteria, and policies govern task posting?
5. Will Bridge handle money or only display budget information?
6. What are the trust, safety, verification, moderation, dispute, cancellation, and reporting rules?
7. What does "match" mean and what behavior follows acceptance?
8. Who owns support and operations, and what response commitments are expected?
9. Which business outcomes matter for a pilot, and what targets are acceptable?

Approval

Business sponsor approval should cover the initial market, operating model, participant roles, payment scope, trust policy, and success measures. The PRD and TRD can then turn the approved business rules into product acceptance criteria and implementation contracts.
