Bridge Marketplace Operations Playbook

Pilot operating procedures | Version 1.0 | 2 November 2026

Purpose and operating principles

This playbook defines a lightweight manual operating model for the Bridge pilot. It covers task quality, participant onboarding, applicant decisions, and marketplace health. It is not a legal policy. Assign named operators before inviting users. Keep decisions consistent, explain actions to affected users, and record only information needed to operate the pilot.

Roles

Role	Responsibilities
Marketplace lead	Owns supply/demand balance, weekly metrics, operating decisions, and escalations.
Task curator	Reviews early task submissions for completeness and follows up on unclear scope or terms.
Student onboarding owner	Helps students complete profiles and choose relevant portfolio highlights.
Support owner	Monitors user help channel and routes product, task, account, and safety issues.
Product/engineering contact	Triage of bugs, data issues, release readiness, and service incidents.

One person may hold multiple roles during a small pilot, but each responsibility needs a clear owner and backup.

Task intake and quality review

1. Confirm the task owner can describe a real piece of work and has a way to respond to applicants.
2. Check title, deliverable, description, skill requirements, budget/currency, deadline, and expected availability are clear.
3. Ask for clarification if success criteria, scope, or deadline are ambiguous; return the task for edits.
4. Ensure the listing does not request unsafe, misleading, or unrelated personal information.
5. Record review outcome: ready, needs edits, paused, or declined. These are proposed internal labels, not current product states.
6. Publish only after the product owner approves what "publish" means in the prototype lifecycle.

Student onboarding

- Explain what Bridge currently supports and what is still a pilot limitation.
- Help the student complete display name, skills, experience, availability, and portfolio link.
- Encourage examples relevant to selected task categories; never imply a profile guarantees work.
- Confirm the participant can receive responses through the product's supported channel.
- Record onboarding completion and unresolved friction, not unnecessary private details.

Application review and decision follow-up

- Ensure applicants can see the task terms before applying.
- Encourage owners to review relevant skills and portfolio evidence consistently.
- Ask owners to record accept/reject decisions in Bridge so participants see accurate status.
- Monitor time-to-first-response and nudge owners according to the pilot response target (target to be set).
- If no decision arrives, contact the owner, then inform applicants of the delay if appropriate.
- Escalate conflicting decisions or suspected duplicate/abusive activity to the marketplace lead.

Marketplace health review

Review weekly:

- Number of active task owners and students in the pilot cohort.
- Tasks ready/published, tasks without qualified applications, and tasks with applications.
- Owner response time and pending decisions.

- Accepted relationships and follow-up communication.
- Repeat intent on both sides.
- Support requests, reports, and unresolved issues.
- Product defects that block profile, posting, application, decision, or messaging flows.

Avoid treating signups, page views, or task budgets as completed marketplace outcomes.

Daily/weekly routines

Daily during the pilot

- Check new task submissions and unanswered help requests.
- Check for blocked core journeys and route technical incidents.
- Review reports promptly according to the separately approved trust/safety process.

Weekly

- Reconcile marketplace funnel counts against source records.
- Review task quality and application relevance with a small sample.
- Identify one operational or product bottleneck to address.
- Update owners on action items and pilot decisions.

Exception handling

Situation	Immediate handling	Owner
Task lacks scope or budget clarity	Pause listing; ask task owner to clarify; notify affected applicants if already visible.	Task curator
Owner not responding	Send a reminder; track aging; inform applicants if delay continues.	Marketplace lead
User cannot access account or task	Capture time, affected flow, and request ID; route as support/technical issue.	Support owner
Applicant reports misleading task	Pause further promotion pending review; preserve relevant task record and escalate.	Marketplace lead
Suspected safety issue	Prioritize reporter safety, restrict further interaction where possible, escalate to named trust owner, and document actions.	Trust owner
Data or service incident	Follow Technical Operations Runbook; avoid ad hoc data edits.	Technical lead

Records and handoffs

Maintain a lightweight issue log with record ID, category, priority, assigned owner, next action, status, and resolution date. Keep operational notes factual. Do not place passwords, payment credentials, or unnecessary sensitive personal information in the log.

Metrics and review

Use definitions from the Analytics and KPI Plan. Each metric needs a named owner and a source of truth. Do not set targets until a baseline exists. Review whether the current operating workload can support another cohort before expanding.

Decisions to complete before pilot

Name primary/backup owners; set owner response target; define task quality checklist; decide manual review authority; approve support channel and hours; agree safety escalation contact; decide when tasks are paused/removed; and define how accepted work is marked complete.
