Bridge User Support Playbook

Pilot support procedures | Version 1.0 | 2 November 2026

Purpose

This playbook helps a small Bridge pilot team answer user questions consistently and route issues to the right owner. It covers product support, not legal interpretation or final dispute policy. Publish a support channel and coverage hours before inviting participants; neither is established in the Stitch screens.

Support principles

- Acknowledge the user's issue in plain language and confirm the affected flow.
- Do not promise a fix time or outcome that the team has not approved.
- Collect the minimum information needed: screen/step, approximate time, task or application reference, device/app version, and request ID if available.
- Never request passwords, verification codes, full payment credentials, or unnecessary sensitive documents.
- Keep support notes factual and limit access to people who need them.
- Route reports of unsafe conduct to the trust owner, not the general bug queue.

Intake categories

Category	Examples	First owner
Account/access	Cannot sign in, Google login issue, profile save failure.	Support; technical owner if reproducible.
Profile	Skill or portfolio edit, visibility question.	Support/product.
Task	Create/edit/publish issue, unclear task details.	Task curator.
Application	Submit failure, duplicate, state unclear.	Support/marketplace lead.
Decision/match	Accept/reject status or match list unclear.	Marketplace lead.
Messaging	Conversation unavailable, message send/read failure.	Support/technical owner.
Trust/safety	Misleading task, harassment, impersonation, privacy concern.	Trust owner via restricted route.
Service incident	Multiple users blocked, data inconsistency, outage.	Technical incident lead.

Priority guidance

- **P1 urgent:** core service unavailable to many users, suspected exposure of private data, or immediate safety concern. Contact the incident/trust lead at once.
- **P2 high:** one user's core flow blocked with no workaround, or active task/application integrity issue. Assign promptly during published coverage hours.
- **P3 normal:** non-blocking defect or confusing behavior with a workaround. Add to the product queue.
- **P4 feedback:** suggestion or request without current user harm. Log for product review.

The team must define actual coverage and response targets; these labels do not imply an SLA.

Triage workflow

1. Acknowledge and classify the request.
2. Check whether the issue blocks a core flow or involves active harm.
3. Record a short description, affected object reference, time, priority, owner, and next update.
4. Reproduce using a test account when possible; do not ask the user for credentials.
5. Route product questions to product, task quality to marketplace operations, safety concerns to the trust owner, and technical failure to engineering.
6. Tell the user what happens next and when the team expects to update them, if a time is known.

7. Confirm resolution with the user when appropriate; close with a short resolution note.

Response templates

Acknowledgment

Thanks for reporting this. I understand the issue is affecting [flow]. I'm checking it with the right owner and will update you when I have a confirmed next step. Please do not send passwords, login codes, or payment credentials.

Need more information

Could you share which screen and step you were on, roughly when it happened, and the task or application reference if relevant? Please leave out passwords, login codes, and payment details.

Known workaround

We've confirmed an issue with [flow]. For now, [approved workaround]. We'll update you when the fix is available; I can't confirm a release time yet.

Resolved

This issue is now resolved. Please try [step]. If it still happens, reply with the screen/step and approximate time so we can reopen the investigation.

Escalation

- Safety or conduct concern to Trust and Safety Operations Guide.
- Possible data exposure or multi-user outage to Technical Operations Runbook and incident lead.
- Task/payment/quality disagreement to Marketplace lead; do not promise adjudication before Bridge's role is defined.
- Repeated support issue to Product owner for root-cause prioritization.
- Account access problem to Technical owner; never request or enter user credentials on their behalf.

Support log fields

Ticket/reference; received time; category; priority; affected object; concise problem; assigned owner; next update due; status; resolution; and whether follow-up is needed. Keep reports of trust/safety concerns in a restricted record rather than a broadly accessible support log.

Weekly review

Review volume and time to resolution by category, recurring blockers, reopened issues, core-flow impacts, and handoffs. Feed repeated problems into the Product Roadmap and KPI review. Do not optimize for closure speed at the expense of safe handling or accurate answers.

Setup checklist

Choose support channel; publish coverage hours; name primary and backup support owners; create issue log with restricted access; agree priority response targets; identify trust and technical escalation contacts; and prepare approved status messages for known outages.
